

Sub-panel Universal Digital Microprocessor Time and Temperature Control

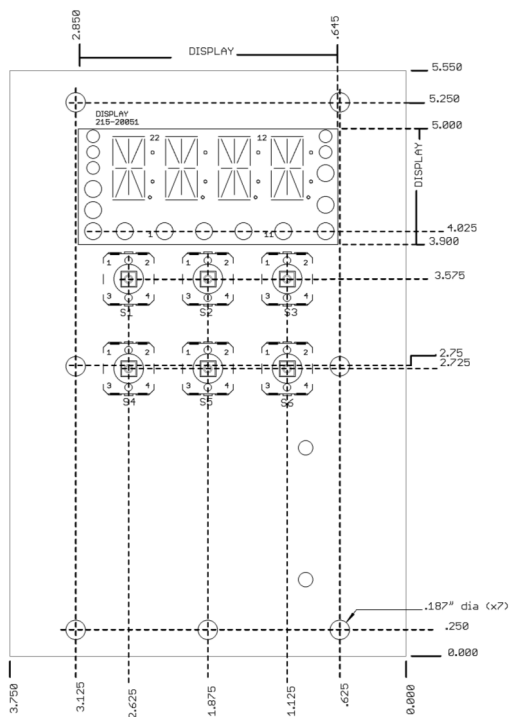

General Description

The Series 130 is an economical high performance time and temperature control. It is a generic micro-processor platform which is configurable and designed to be a one-size-fits-all controller. The design uses a microprocessor which can be programmed to accept RTD, NTC, or PTC probes. It has up to 5 probe inputs, 3 relay outputs, and 2 open collector drivers. It has a potentiometer input, and 6 pushbutton switches. The custom 14 segment alpha-numeric display provides a versatile user interface. The icon based display provides pertinent information at a glance. The controller has a USB interface for communication or software updates. There is also an optional port used for CAN and Serial communications and add on expansion boards. If you need a time/temperature or temperature control, please email sales@QuantemCorp.com to discuss your application. The Series 130 platform is low cost and versatile while providing high end options and performance.

Specifications

Line Voltage:	120 +/-15% or 240 +/-10% 50/60 Hz VAC, 12VAC/DC or 24 VAC/DC factory set .	Outputs	5 open collector drives 3 of which are configured for mechanical relay options.
Inputs	5 analog / digital inputs	USB	USB port for boot loader and external interface
Switch Inputs	6 on board tactile plus	Audible	On board speaker 2400Hz 90db with variable tones.
Expansion	Accepts custom expansion modules	Expansion	Accepts custom expansion modules.
Communication: CAN, UART, USB, expansion board port		Agency	CuR E70308

Dimensional Outline

How to Order

All possible combinations not listed, call factory for details.
